■ Scrap retention button dies (Products data P.1619)

●Applicable range

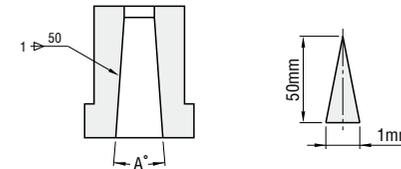

- Hole diameter: $\phi 1.0 \sim \phi 16$
- Workpiece material: Can be used for materials with tensile strengths up to 1177N/mm² (120Kg/mm²)
- Thickness of workpiece material: Minimum thickness 0.15mm
- Scrap retention effects cannot be expected when the clearance (C) is larger than the workpiece material thickness (MT) by more than 20%. Therefore, keep the difference to 20% or less.

Clearance on one side (C) < Workpiece material thickness (MT) × 20%

- Because scrap retention button dies prevent scrap lifting by forming small projections on punching scrap, they are not suitable in cases such as punching of precision holes, or when the punched-out item becomes the product.

■ Non-clogging button dies (Products data P.1621)

■ Indication of button die relief angles

1/50 indicates a taper in which the diameter increases by 1 mm over 50 mm of length.

Taper	1/50	1/100	1/150
Angle (A°)	1.146°	0.573°	0.382°

Example

Features

- These non-clogging carbide button dies are intended to be used in combination with a vacuum device such as a vacuum pump.
- Because an air inlet hole is created near the shaped hole, when a vacuum device is used to provide suction, an air flow is produced inside the button die. As a result, the scrap removal effect is higher than in button dies without air inlet holes. (Figure 1)
- It is also possible to use products such as a scrap vacuum unit (P.385) or commercially available pail-mounted cleaner as the vacuum device in place of the vacuum pump. In these cases, the drive source is compressed air from a compressor or other machine. (Figure 2)
- Non-clogging button dies (Products data) P.1621

(Figure 1) Effect of air inlet hole

Example

Features

- These non-clogging carbide angular button dies are intended to be used in combination with a vacuum device such as a vacuum pump.
- Because an air inlet hole is created near the shaped hole, when a vacuum device is used to provide suction, an air flow is produced inside the button die. As a result, the scrap removal effect is higher than in button dies without air inlet holes. (Figure 1)
- It is also possible to use products such as a scrap vacuum unit (P.385) or commercially available pail-mounted cleaner as the vacuum device in place of the vacuum pump. In these cases, the drive source is compressed air from a compressor or other machine. (Figure 2)
- Non-clogging button dies (Products data) P.1621
